The method is useful for identifying an orthosomycin biosynthetic gene, gene fragment or gene cluster, especially an everninomicin-type or avilamycin-type orthosomycin biosynthetic gene, gene fragment or gene cluster. The method is useful for detecting the presence of any organism that contains DNA for the production of orthosomycins (both everninomicin-type orthosomycins and avilamycin-type orthosomycins) regardless of the level at which genes for orthosomycin production are expressed by the organism or the amount of orthosomycin produced by the organism. This allows for the detection of new

The method is useful for identifying an orthosomycin biosynthetic gene, gene fragment or gene cluster, especially an everninomicin-type or avilamycin-type orthosomycin biosynthetic gene, gene fragment or gene fragment or gene fragment or gene fragment or gene fragment or gene cluster. The method is useful for detecting the presence of any organism that contains DNA for the production of orthosomycins (both everninomicin-type orthosomycins and avilamycin-type orthosomycins) regardless of the level at which genes for orthosomycin production are expressed by the organism or the amount of orthosomycin produced by the organism. This allows for the detection of new

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequence of Pseudomonas species using biochip technology. Sequences ABD01397-ABD17967 represent P. aeruginosa polypucleotides of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 507
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; SEQ ID NO 11493;

                                                                                        Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therefore therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as targets for actibacterial drugs, production of P. aeruginosa-derived peptides for recombinant components for diagnosis and/or treatment of P. aeruginosa-derived peptides, as target for polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABD1397-ABD17967 represent P. aeruginosa polymucleotides of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at

Sequences ABD01397-ABD17967 represent P. aeruginosa polymucleotides of the invention. When sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis a therapy of pathological conditions, as molecular targets for diagnosis prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant
                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated nucleic acid encoding Pséudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure; SEQ ID

                                                                        The snaC gene product is involved in the biosynthesis of streptogramins, antibiotics active against Gram-positive bacteria. The identification of the sequences encoding the enzymes involved in the biosynthetic pathway means that they can be isolated and manipulated. Mutant microorganisms in which a step in the streptogramin biosynthetic pathway is blocked can be cultured to produce streptogramin intermediates, which may later be

        in the biosynthesis of streptogramins, antibiotics active against Grampositive bacteria. The identification of the sequences encoding the enzymes involved in the biosynthetic pathway means that they can be isolated and manipulated. Mutant microorganisms in which a step in the streptogramin biosynthetic pathway is blocked can be cultured to produce streptogramin intermediates, which may later be converted to streptogramin derivatives. Recombinant cells may also be used for the bioconversion of streptogramins from one form to another or for the
                                                                                                                                                                                 DNA involved in streptogramin ar -conversion of streptogramin(s) derivs. or hybrid antibiotics.

The invention relates to identifying orthosomycin biosynthetic its fragment/gene cluster (ABZ66670-ABZ66813), comprising deter presence of a nucleic acid sequence coding for a polypeptide (ABP99362). The method is useful for identifying an orthosomycin biosynthetic gene, gene fragment or gene cluster, especially an everninomicin-type or avilamycin-type orthosomycin biosynthetic gene cluster. The method is useful for detectigene fragment or gene cluster.

This allows for the detection of new orthosomycin natural products, not produced by the organism

Patent No. 6833447

GENERAL INFORMATION:
APPLICANT: Goldman, Barry S.
APPLICANT: Hinkle, Gregory J.
APPLICANT: Hinkle, Gregory J.
APPLICANT: Slater, Steven C.
APPLICANT: Wiegand, Roger C.
TITLE OF INVENTION: Myxococcus xanthus Genome Sequences and Uses Thereof FILE REFERENCE: 38-10(15849)B
CURRENT APPLICATION NUMBER: US/09/902,540
CURRENT APPLICATION NUMBER: US/09/902,540
CURRENT APPLICATION NUMBER: 60/217,883
PRIOR APPLICATION NUMBER: 60/217,883
PRIOR FILING DATE: 2000-07-10
NUMBER OF SEQ ID NOS: 16825
SEQ ID NO 2740
LENGTH: 1963
TYPE: DNA
Sequence 1129, Application US/09902540
PALENT NO. 6833447

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 France, as described in Bonaldo, M.F., Lennon, G. and Soares, M.B. (1996), Genome Research 6(9): 791-806. This clone is from library BEO3, a normalized library of embryonic tissues subtracted with 7800 known placental EST sequences. The double stranded cDNA was size selected (more than 450 bp), adaptored with EcoRI adaptors at both ends and then digested with NotI. The cDNA was then directionally cloned into EcoRI-NotI digested gGEM11Ef(+) phagemid vector. Insert size was between 450-2200 bp. Sequencing was done from the 5' end of the clone. Tagged oligo-dT was used to identify the source of the ESTs where possible. (A18)TGCGT = extraembryonic tissue, (A18)TGCGT= 36-day old fetus; (A18)TGCGA = 64-day old fetus (organs); (A18)TGCGA = 64-day old fetus (organs)
